

A SMARTER WAY TO FORECAST

Intermittent SKUs

Michael Polutta, Product Manager

BLUEPRINT 2019
PLANNING FOR A FLEXIBLE FUTURE

WHAT IS INTERMITTENT DEMAND?

- When demand is not consistent in frequency
 - One or more periods with demand
 - Followed by one or more periods with no demand

THEY LOOK LIKE THESE

Intermittent

Lumpy

WHAT MAKES INTERMITTENT DEMAND DIFFICULT TO FORECAST?

- As the forecast gets smaller, accuracy suffers.
 - Regular smoothing algorithms are designed for continuous demand and faster movement.
 - You can't sell a partial unit of most items. (refers to forecast < 1)
 - Standard deviation (and thus, safety stock) overreacts.
- The variation in the demand pattern means that AES will respond too slowly to be effective.
 - For consistently-moving SKUs this slowness is a feature.

THERE ARE TWO THINGS GOING ON WITH THESE PATTERNS

- Inconsistent, but low, demand
- Varying spaces between the demand hits

Let's examine these patterns with this in mind.

INTERMITTENT

- Inconsistent demand
- Varying spaces between the demand hits

LUMPY

- (Wildly) Inconsistent demand
- Varying spaces between the demand hits

SO WHAT IF WE TREATED THEM AS TWO DIFFERENT THINGS

- Demand hits with different values
- Varying spaces between the demand hits

AND SMOOTHED EACH ONE SEPARATELY?

WITH A SMOOTHED DEMAND VALUE AND A SMOOTHED SPACING

- The forecast could be calculated using the smoothed demand value TOGETHER WITH the smoothed spacing value.
- And that's what we do!
- We call this Intermittent Demand Forecasting (IDF)

WHAT SHOULD YOU EXPECT?

- You should *NOT* expect a seismic shift in the forecast.
- You should expect more consistent safety stock.
 - Less overreaction to demand
 - So, generally speaking, lower standard deviation
- You should expect this to be easier to see for weekly SKUs.

SO, WHAT DOES IT TAKE?

- Intermittent Demand Forecasting (IDF) must be turned on – back-end config switch
- Auto-select must be enabled
- DCSI classification must be run
 - If a SKU is classified as **intermittent** AND
 - If a SKU is classified as a slow-mover it will be a candidate for IDF

SKU-LEVEL CHANGES

- No seasonality is allowed
 - “Create Seasonal Profile” is disabled.
 - “Day of week” profiles are disabled.
- Any existing profiles (either type) are removed automatically.

HOW CAN YOU TELL?

- On the Item Forecast page it will show “**Intermittent Demand Forecasting**” as the forecasting method.
- In the Item List filter, a new dropdown for “Forecasting Method” is in effect.

HOW CAN YOU TELL?

 Create Seasonal Profile

 Create Daily Profile

Intermittent Demand Forecasting

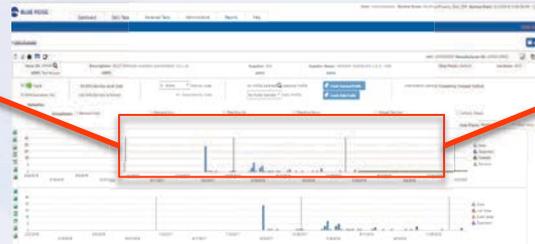

Weekly  Forecast Frequency

Missed Service

Infinity Check

LET'S COMPARE

LET'S COMPARE

	IDF ITEM	AES ITEM	SAFETY STOCK
DEVIATION (%)	70.95%	400.00%	IDF = 24 days 1.77 units
WEEKLY	0.51	0.02	AES = 170 days 0.58 units
4 WEEKLY	2.02	0.09	
QUARTERLY	6.58	0.31	
YEARLY	26.32	1.23	

ALERTS

- The only alerts raised for IDF are:
 - Demand High
 - Trending up
 - Trending down

AND NOW FOR SOMETHING COMPLETELY DIFFERENT...

- Coming soon to an SCP near you...

INTELLIGENT MINIMUM/MAXIMUM

- A different way to set order parameters for slow-moving SKUs
- Analyze demand history in context of:
 - Low stock point time frame
 - Order Up To Level time frame
 - Service goal

THE GOAL OF IMM

- Make it easier to manage slow-moving SKUs by doing most of the work for you.
- The system ensures that it orders exactly how much is needed to ensure service – no more, no less.
- Free your time to focus on more valuable items.

KEY ENABLER FOR THE FUTURE OF SCP

- Coming later this year.

THANK YOU!
